

**AMENDMENTS TO THE SPECIFICATION**

**Please replace the paragraph no. 42 with the following amended paragraph:**

Collector protection member 10 is 100 $\mu$ m in ~~thickens~~thickness and is made of PP (polypropylene). Therefore, collector protection member 10 is flexible, and even if a force is exerted on anode tab 4b from the outside and anode tab 4a abuts against collector protection member 10, there is no case in which the abutted portion will be locally bent. Incidentally, the material of collector protection member 10 is not limited to PP, and any material is available as long as it is non-erosive with the electrolytic solution and is flexible.
